
clamav perl module

Posted by lazaro - 2007/09/05 04:40

I have just installed the postfix mail server in centos 5. I have used all the instructions which were provided in this site. The system is running ok.

But i have observed the following errors when i run

```
-tail -f /var/spool/maillog
```

ClamAV Perl module not found, did you install it? .

Actually i run the command yum install clamav perl and it was installed. I was not able to open the instructions from this website for configuring it.

Any one to help me please.

The second problem is if i enable the line /^Received:/ HOLD in the file /etc/postfix/header_checks . Then mails will not be delivered. And if i uncomment this line then mails will be delivered.

Please anyone to help.

Ragards,

Lazaro

I would advise using the Clamav/Spamassassin install script from here.

<http://www.mailscanner.info/downloads.html>

A lot less painful when it comes to the perl modules.
